Prerinse any stuckon food or tough stains. Close the dishwasher door, ensuring that you hear a click when you are ready to begin the wash cycle. This Classixx semi integrated dishwasher has a generous 12 place setting capacity, making it ideal for a busy home. Powered by WordPress.org, Opravy rucniho naradi Smecno. With the dishwasher powered off remove the bottom dish rack to give yourself better access to the basin of the dishwasher. It's not the most pleasant job if the tub is still full of dirty water, but the filter tube should still be easily visible and can be removed with an anticlockwise twist. If it is indeed the culprit then simply removed the debris and give the filter a good wash and rinse. If your Bosch dishwasher is still not draining then you'll need to continue downwards into the basin and towards the drain pump. At this point you're going to need to remove as much water as possible from the dishwasher to allow you to examine the drain pump. A wet dry vacuum is the ideal tool for this job but if you haven't got one to hand then you'll have to make do with scooping out as much as you can then and using kitchen towels to soak up the remaining water sitting down in the sump.

Once you've shifted the water it's time to remove the drain pump cover, which on most Bosch dishwashers will be secured with a single screw. Remove that using a screwdriver and then take off the cover by gripping the tab on the left and lifting it up and towards you. On top of the pump are impeller blades which are used to force the water out of the basin and into the pump. Just like you did with the filter, check for and bits of food debris which could be preventing the water from draining. Replace the drain pump cover, then the drainage mesh, then the filter, and finally the lower dish rack. Now run your dishwasher on it's shortest cycle to check if you've managed to fix the problem. Check the dishwasher waste pipe for obstructions. It's unlikely any large pieces of food debris have found there way through both the filter and the drain pump, but grease and fat can get through whilst hot and then turn solid as they cool down. Try squeezing the waste pipe along it's length to break it up, then run on the dishwasher on it's hottest cycle to shift any remnants. Fortunately they are not very expensive although you might want to consider paying for a professional to do the job if you aren't confident doing repair work yourself. It could be something simple, especially if you just installed it. Make sure the power cord is connected properly and a circuit breaker did not trip. After that, if its water line was not flushed before installation, it might have air bubbles inside that keeps the water from flowing through the hose with the right amount of pressure. Disconnect the water supply line from the dishwasher and flush 2 gallons of water through it before reinstalling the hose. If that fails, troubleshoot your Bosch dishwasher filling problem by process of elimination. Cycle Interruption A Bosch dishwasher does not fill with water if the previous cycle was interrupted.

If it was turned off for any reason and mistakenly left off, the dishwasher cannot fill with water, even though the unit comes on. Look for a kink in the water supply line. If you find one, shut off the water valve, and remove the hose and kinks. Reattach the water supply hose and turn on the valve. Hose Filter Most Bosch dishwashers contain a small filter inside the hose end to prevent sediment from your water supply getting inside the dishwasher. With the water supply hose disconnected, remove the filter from inside the hose, clean it thoroughly to remove any iron buildup or sediment, and replace. Reinstall the hose line and reopen the water supply valve. Water Pressure Verify you have enough water pressure to run the dishwasher. Grab a 1 gallon container and turn the faucet on to fill it. If you have enough water pressure to run the dishwasher, the container should fill up within 30 seconds. If it takes longer to fill a gallon container, you might not have enough pressure in your water delivery system to effectively use the dishwasher. Pooling Water The dishwasher does not fill for a new cycle when it has not drained from the last. If you open your dishwasher to find a pool of water inside, locate the largeobject trap in the center bottom of the dishwasher. Remove the bottom tray to access the largeobject trap. Turn the top of the largeobject trap counterclockwise onequarter turn and lift it out. Thoroughly clean its mesh filter. Remove any large objects such as toothpicks, bones, broken glass or food debris from the filter area. Clean the large mesh screen that surrounds the largeobject trap before reinstalling everything in reverse of removal. Close the door to see if the dishwasher drains. If it does, you are free to start the next cycle. Water Inlet Valve Inside the bottom front of the dishwasher behind the kick panel, there is a water inlet valve that operates via electricity.

Remove the Bosch power cord from the outlet or shut off power to the unit at the circuit breaker. Remove the kick panel by unscrewing the two screws on either side. Detach the screws that hold the front door panel in place from inside the dishwasher; pull the door panel down and set it aside. Close the door to access the water inlet valve. The water inlet valve has two wires that connect it to the circuitry of the unit. Check to ensure they are firmly attached. Also examine the valve for damage or leaks. If it is damaged, buy the part using the right model number for your dishwasher and replace it; otherwise, contact an appliance repair technician to do it for you.
